                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

In the specification. The novel human nuclear hormone receptor with a fully defined sequence of 457 amino acids given in the specification. The novel human nuclear hormone receptor peptides and nucleic acids encoding them can be used as models for the development of human therapeutic targets, aid in the identification of therapeutic proteins, and serve as targets for the development of human therapeutic construct receptor activity in cells and tissues that express the nuclear hormone receptor activity in cells and telescent sequence to perform searches against sequence of databases to identify family members or related sequences, as probes or primers, to construct recombinant vectors, to identify compounds that modulate nuclear hormone receptor nucleic acid expression, in gene construct recombinant vectors, to identify compounds that the modulate nuclear hormone receptor nucleic acid expression, in gene expression in cells, tissues or organisms. The polypeptides can be used to raise antibodies or to elicit an immune response, as a reagent in assays designed to determine protein levels in biological fluids, as markers for tissues in which a corresponding protein is expressed, to identify a binding partner/ligand to develop a system for the clienting assays, and to identify compounds that modulate protein activity. This polymerication of inhibitors of the binding reaction, in drug screening assays, and to identify compounds that modulate protein activity. This control con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10299

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Retinoic acid receptor (RAR-alpha) RNA (AAT33247) is a substrate for ribozymes, external guide sequences and antisense oligonucleotides (see also AAT33245 and AAT33245-58) used for the treatment of acute promyelocytic leukaemia (APL). APL is characterised by a balanced, reciprocal translocation between the long arms of chromosomes 15 and 17, resulting in a fusion of the retinoic acid receptor gene (see also AAT33260) and a gene for a putative transcription factor, PML. The ribozymes etc. specifically cleave the PML-RAR-alpha fusion mRNA but not wild-type RAR-alpha mRNA.
                                                                                                                                                                                                                            RNA construct(s) including ribozyme(s) and antisense oligo:nucleotide(s) - for the inactivation of RNA associated with, e.g. promyelocytic leukaemia or follicular lymphoma

```

```
Acute promyelocytic leukaemia (APL) is associated with a translocation between the long arms of chromosomes 15 and 17. resulting in the fusion between the retinoic caid receptor gene (RAR-alpha, AAT33260) and PML, a putative transcription factor gene. The fusion product RNA (see also AAT33246) junction region (AAT33251) is the target for ribozymes (AAT33245, AAT33248, AAT33250 and AAT33252), external guide sequences (AAT33253-54) and antisense constructs (AAT33255-57) that specifically cleave the PML-RAR-alpha fusion mRNA but not wild-type RAR-alpha mRNA (see also AAT33247).

(I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) as useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cappositics, forensics, gene mapping, identification of mutations candino acid sequences. AASK4197-AAS4954 represent novel human and and anno acid sequences. AASK4197-AAS4954 represent novel human

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical immaging of sites expressing (II). (I) are useful in medical immaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (III). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques
The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human high grequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                            887
                                                                                                                                                                                                                                                                                946

to restore normal activity of (II) or to treat disease states involving (II) (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amin acid sequences. A&S64197-A&S94564 represent novel human call agreements of the invention.

Colagnostic coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                     ö

In the specification in most manner in the second second second and nucleic acids encoding them can be used as models for the development of human therapeutic proteins, and serve as targets, aid in the identification of therapeutic of human therapeutic proteins, and serve as targets for the development of human therapeutic agents that modulate nuclear hormone receptor activity in cells and tissues that express the nuclear hormone receptor. The nucleic acids may be used as a query sequence to perform searches against sequence databases to identify family members or related sequences, as probes or primers, to construct recombinant vectors, to identify compounds that cherapy, and as antisense constructs to control nuclear hormone receptor nucleic acid expression, in gene expression in cells, tissues or organisms. The polypeptides can be used to raise antibodies or to elicit an immune response, as a reagent in assays designed to determine protein levels in biological fluids, as markers for tissues in which a corresponding protein is expressed, to identify a binding partner/ligand to develop a system for the identify campounds that modulate protein activity. This cassays, and to identify compounds that modulate protein activity. This polynucleotide sequence represents the cDNA encoding the human nuclear
                                                                                             The invention relates to an isolated peptide of a novel human nuclear hormone receptor with a fully defined sequence of 457 amino acids given in the specification. The novel human nuclear hormone receptor peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            860

This truncated cDNA, designated RAR-alpha-403, encoded a protein (AAR68024) containing the N-terminus, DNA-binding domain and part of the hormone-binding domain of RAR-alpha (AAR68023). RAR-alpha-403 has negative suppressor activity. Introduction into multipotent IL-3 dependent FDCP mix A4 cells (murine hematopoietic) caused a switch from neutrophil/monocyte differentiation to basophil/mast cells (30-50%), with only 2% neutrophils.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    888 ACTCTCCACCAAGTGCATCATTAAGACTGTGGAGTTCGCCAAGCAGCTGCCCGGCTTCAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New haematopoietic stem cell lines with specific differentiation properties - made by transfected stem cells with nucleic acid encoding dominant negative suppressor of the retinoic acid receptor alpha, useful e.g. for haematopoietic reconstitution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           948 CACCCTCACCATCGCCGACCAGATCACCCTCCTCAAGGCTGCCTGGACAT 1001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PECR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) and ists binding pariners are useful in medical imaging of sites expressing (II). (I) and ists binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are binding partners are useful for treating disorders involving aberrant protein expression or biological activity. (I peptide and polypeptide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and continuous and sequences as AAS64454 represent novel human diagnostic coding sequences of the invention.

                                                                            g
                                                                                                                                                                                                     The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated comparing the expression level to an expression of Gs is indicative of GCA.

Also included are medulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening (M3) crownic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the choic) in a tissue, an altergic response in a subject exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having in the tissue, MI is useful for detecting GAN, M2 is useful for from GAN, M2 is useful for manial for firen GAN, M2 is useful for manial for firen GAN, M2 is useful for manial for manial for firen GAN, M2 is useful for manial for firen GAN, M2 is useful for manial

retinoic acid receptor (RAR) alpha gene. This gene is disrupted in a translocation of a portion of the long arm of chromosome 17 onto the long arm of chromosome 15 [f(15;17) (q21;q11-22)]. This causes a fusion between RAR-alpha and myl which is characteristic of acute promyelocytic leukemia (APL). The breakpoint region has been cloned and it has been shown that DNA rearrangements are clustered in the region of the first intron of RAR-alpha. This sequence was isolated by polymerase chain reaction (PCR). The primers used for amplification of this sequence can also be used to amplify the translocated region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                828 GAACAACAGCTCAGAACAACGTGTCTCTCTGGACATTGACCTCTGGGACAAGTTCAGTGA 887

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                                                                                                     The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL7010), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the treatment of canneer such as socion, breast, stomach, lung, thyroid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocaricationam, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.

                                                                                                                                                                                                                                                                           This sequence encodes the human retinoic acid receptor alpha, RAR-alpha which is used in a method for identifying a subject with acute promyelocytic leuksemia (APL) resulting from a t(15;17) translocation who will respond to treatment with all-trans retinoic acid. The protein can also be used to identify a subject with indications of APL who will not respond to treatment with all-trans retinoic acid.

Sequence 13, Application US/08892747

Patent No. 6057153
GENERAL INFORMATION:
APPLICANT: Shaji T. George, Michael Ma, Martina Werner,
APPLICANT: Umberto Pace and Allan R. Goldberg
TITLE OF INVENTION: Stabilized External Guide Sequences
NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS:
ADDRESSEE: Patrea L. Pabst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NAME/KEY: misc_feature
LOCATION: 1..3511

Petent No. US2020106765A1

GENERAL INFORMATION.

APPLICANT: Kinders, Robert

APPLICANT: Corey, Michael J.

TITLE OF INVENTION: PLI-18 POLYPEPTIDES, NUCLEIC ACIDS

TITLE OF INVENTION: ENCODING THE SAME AND METHODS FOR SCREENING FOR OR

TITLE OF INVENTION: MODULATING THE SAME

PILE REFERENCE: 130001.406

CURRENT APPLICATION UNMBER: US/09/804,682

CURRENT FILING DATE: 2001-03-12

NUMBER OF SEQ ID NOS: 174

SEQ ID NO 33

Site_2: Noti; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including ECOR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Topolof' by electroporation method: The cDNA libraries constructed by this method are full-length enriched cDNA library. After analyzing and sequencing about 2,000 - 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5' primer and N(dT)44 as 3' primer. The PCR products were used as transfed RNA by in vitro transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA alibraries were constructed by transformation of the remaining DNA into competent cells E. coll ToplOF' with
